Tests

File	What it is
`test_pic_cpu_backend.py`	Automated tests (28) for the Python core
`run_demo.py`	Runs the demonstration program and prints every trace
`demo_program.txt`	The demonstration program (all 8 instructions)
`test_cases.md`	Test case table with expected and actual results
`test_results.txt`	Raw output of the last test run
`demo_run_output.txt`	Raw output of the last demo run

How to run

Needs Python 3.8 or newer. No extra packages. Nothing else needs to be running: each test starts its own copy of the backend and a mock logger.

```
python -m unittest discover -s tests -v
python tests/run_demo.py
```

Ports 45772 and 45773 must be free. Close the real backend and the real logger first. The tests look for `pic_cpu_backend.py` in `src/`, then the repository root, then this folder.
